AMENDMENTS TO THE CLAIMS:

The listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1-14 (Cancelled)
- 15. (Previously Presented) A power generator in a hybrid car comprising:

a motor generator mechanically connected with the crank shaft of an internal combustion engine for driving a car wherein said internal combustion engine is started by electric power supplied by a battery device and power is generated by rotation from said internal combustion engine to charge said battery device, an inverter for controlling the drive and power generation of said motor generator, and a control circuit for controlling said inverter;

said hybrid car further characterized in that;

said motor generator is driven by battery power to start said internal combustion engine, and, after said internal combustion engine has started, said battery device is charged by a generator mode operation of said motor generator using the power of said internal combustion engine;

wherein a step-down chopper circuit is provided between the battery and the inverter, and step-down control is provided to ensure that the power generation voltage will reach the level of the battery charging voltage through

said step-down chopper circuit.

16. (Previously Presented) A power generator in a hybrid car

comprising:

a motor generator mechanically connected with the crank shaft of an

internal combustion engine for driving a car wherein said internal combustion

engine is started by electric power supplied by a battery device and power is

generated by rotation from said internal combustion engine to charge said

battery, an inverter for controlling the drive and power generation of said motor

generator, and a control circuit for controlling said inverter;

said hybrid car further characterized in that;

said motor generator is driven by battery power to start said internal

combustion engine, and, after said internal combustion engine has started, said

battery device is charged by a generator mode operation of said motor generator

using the power of said internal combustion engine;

wherein a step-up chopper circuit is provided on the output side of the

battery device, and, when the motor generator is started by the electric power of

the battery device, a battery voltage is stepped up to drive said motor generator

and to start said internal combustion engine.

Serial No. 09/936,481

Amendment Dated: July 16, 2004

Reply to Office Action: March 16, 2004

17. (Previously Presented) A power generator in a hybrid car

according to claim 15 wherein said motor generator is a permanent magnet field

motor generator having its rotor equipped with a permanent magnet and

constituting a field pole or a jaw type magnetic pole synchronous motor

generator having its rotor with jaw type magnetic pole field, wherein the weak

field rate is 1 to less than 4.

18. (Previously Presented) A power generator in a hybrid car

according to claim 16 wherein said motor generator is a permanent magnet field

motor generator having its rotor equipped with a permanent magnet and

constituting a field pole or a jaw type magnetic pole synchronous motor

generator having its rotor with jaw type magnetic pole field, wherein the weak

field rate is 1 to less than 4.

19. (Previously Presented) A power generator in a hybrid car

according to claim 15 wherein said motor generator is an induction motor

generator having its rotor equipped with multiple secondary conductors and the

weak field rate is at least one.

Page 4 of 24

20. (Previously Presented) A power generator in a hybrid car according

to claim 16 wherein said motor generator is an induction motor generator having

its rotor equipped with multiple secondary conductors and the weak field rate is

at least one.

21. (Previously Presented) A power generator in a hybrid car

according to claim 15 wherein said battery device comprises an auxiliary battery

of 14-volt charging voltage as a light source for a lamp device, and a main

battery of 42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the voltage generated by said motor generator is greater than

charging voltage of said main battery, voltage control is performed by said step-

down chopper circuit to step down said voltage until it agrees with the charging

voltage of said main battery.

Page 5 of 24

22. (Previously Presented) A power generator in a hybrid car

according to claim 16 wherein said battery device comprises an auxiliary battery

of 14-volt charging voltage as a light source for a lamp device, and a main

battery of 42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the voltage generated by said motor generator is greater than

charging voltage of said main battery, voltage control is performed by said step-

down chopper circuit to step down said voltage until it agrees with the charging

voltage of said main battery.

23. (Previously Presented) A power generator in a hybrid car

according to claim 17 wherein said battery device comprises an auxiliary battery

of 14-volt charging voltage as a light source for a lamp device, and a main

battery of 42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

Page 6 of 24

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the voltage generated by said motor generator is greater than

charging voltage of said main battery, voltage control is performed by said step-

down chopper circuit to step down said voltage until it agrees with the charging

voltage of said main battery.

24. (Previously Presented) A power generator in a hybrid car

according to claim 19 characterized in that said battery device comprises an

auxiliary battery of 14-volt charging voltage as a light source for a lamp device,

and a main battery of 42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

Page 7 of 24

wherein, if the voltage generated by said motor generator is greater than charging voltage of said main battery, voltage control is performed by said step-

down chopper circuit to step down said voltage until it agrees with the charging

voltage of said main battery.

25. (Previously Presented) A motor generator control method for a

hybrid car comprising:

a motor generator mechanically connected with the crank shaft of an

internal combustion engine for driving a car wherein said internal combustion

engine is started by electric power supplied by a main battery and power is

generated by rotation from said internal combustion engine to charge said main

battery, an inverter for controlling the drive and power generation of said motor

generator, and a control circuit for controlling said inverter;

said hybrid car further characterized in that;

if the voltage generated by said motor generator is greater than charging

voltage of said main battery, voltage step-down control is performed by a step-

down chopper circuit to step down said voltage until it agrees with the charging

voltage of said main battery.

26. (Previously Presented) A motor generator control method for a

hybrid car according to claim 25 wherein said main battery is charged by

operation of said motor generator in the generation mode wherein;

Page 8 of 24

if the voltage generated by said motor generator is greater than charging

voltage of said main battery, said voltage is stepped down by said step-down

chopper circuit;

at the same time, and the current phase of a stator winding of said motor

generator is controlled to get weak field component by armature reaction

magnetic flux to ensure that said generated voltage agrees with said battery

charging voltage.

27. (Previously Presented) A motor generator control method for a

hybrid car comprising:

a motor generator mechanically connected with the crank shaft of an

internal combustion engine for driving a car wherein said internal combustion

engine is started by electric power supplied by a main battery and power is

generated by rotation from said internal combustion engine to charge said main

battery, an inverter for controlling the drive and power generation of said motor

generator, and a control circuit for controlling said inverter;

said hybrid car further characterized in that;

when said motor generator is started by electric power of said battery, a

step-up chopper circuit is provided on the output side of said battery to step up

said battery voltage to drive said motor generator and start said internal

combustion engine, and;

Page 9 of 24

if a voltage generated by said motor generator is greater than charging

voltage of said main battery, voltage step-down control is performed by a step-

down chopper circuit to step down said voltage until it agrees with the charging

voltage of said main battery.

28. (Previously Presented) A motor generator control method for a

hybrid car according to claim 27 wherein in the startup operation by said motor

generator, the current phase of a stator winding is controlled by said inverter to

obtain a strong field current component whereby said internal combustion

engine is started.

29. (Previously Presented) A motor generator control method for a

hybrid car according to claim 27 wherein;

said motor generator is a permanent magnet synchronous motor generator

or jaw type magnetic pole synchronous motor generator;

when said internal combustion engine is started, strong field control is

made by the inverter until the rotational speed requiring the maximum torque is

reached, and, at the same time, the step-up chopper circuit is operated to make

motor-applied voltage greater than the battery voltage and to get the motor

current to have a specified current value, thereby obtaining the maximum

torque; and

Page 10 of 24

when torque assist function is used until a high rotational speed is

reached, weak field current component control is performed through control of

the current phase of said stator winding, and, at the same time, the step-up

chopper circuit is operated to increase the motor applied voltage so that the

motor current is kept at the minimum.

30. (Previously Presented) A motor generator control method for a

hybrid car according to claim 25 wherein;

said motor generator is a permanent magnet synchronous motor generator

or jaw type magnetic pole synchronous motor generator;

when power is generated by said motor generator after start of said

internal combustion engine is started, stator winding current phase is controlled

to get strong field current component if the internal combustion engine speed is

close to idling speed;

then with the increase in internal combustion engine speed, the current

phase of said stator winding is controlled to get strong field current component,

thereby keeping generation voltage at the level of charging voltage; and

with further increase in engine speed, generation voltage is stepped down

by the step-down chopper circuit with the state of weak field current component

kept unchanged, and voltage control is made to ensure that generation voltage

agrees with battery charging voltage.

Serial No. 09/936,481

Amendment Dated: July 16, 2004

Reply to Office Action: March 16, 2004

31. (Previously Presented) A motor generator control method for a

hybrid car according to claim 27 wherein;

said motor generator is an induction motor generator;

when said internal combustion engine is started, the current phase of said

stator winding is controlled so that strong field control component is obtained

until the rotational speed requiring the maximum torque is reached, and at the

same time, the step-up chopper circuit is operated to make motor-applied voltage

greater than the battery voltage, thereby obtaining the maximum torque even if

the stator winding current is small at the time of internal combustion engine

startup; and

when torque assist function is used until a high rotational speed is

reached, weak field control is performed, and, at the same time, the step-up

chopper circuit is operated to increase the motor-applied voltage, thereby

obtaining the assist torque.

32. (Currently Amended) A motor generator control method for a

hybrid car according to claim 27 wherein;

when said motor generator is started by said battery power, a step-up

chopper circuit is installed on the output side of said battery and the conversion

voltage ratio of said battery voltage is set at 1.5 times or more, to ensure that the

current capacity of the a first switching element of said inverter main circuit is

Page 12 of 24

smaller than that of the a second switching element of said step-up chopper

circuit.

33. (Previously Presented) A motor generator control method for a

hybrid car according to claim 25 wherein an auxiliary battery of 14-volt charging

voltage is used as a light source for a lamp device, and said main battery has a

42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than

the charging voltage of said main battery, voltage control is performed to step

down the generation voltage through said step-down chopper circuit so that it

agrees with the charging voltage of said main battery is reached.

34. (Previously Presented) A motor generator control method for a

hybrid car according to claim 26 wherein an auxiliary battery of 14-volt charging

Page 13 of 24

voltage is used as a light source for a lamp device, and said main battery has 42-

volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than

the charging voltage of said main battery, voltage control is performed to step

down the generation voltage through said step-down chopper circuit so that it

agrees with the charging voltage of said main battery is reached.

35. (Previously Presented) A motor generator control method for a

hybrid car according to claim 27 wherein an auxiliary battery of 14-volt charging

voltage is used as a light source for a lamp device, and said main battery has a

42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

Page 14 of 24

the battery is charged by operation of said motor generator in the generation mode using the power of the internal combustion engine after said internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than the charging voltage of said main battery, voltage control is performed to step down the generation voltage through said step-down chopper circuit so that it agrees with the charging voltage of said main battery is reached.

36. (Previously Presented) A motor generator control method for a hybrid car according to claim 28 wherein an auxiliary battery of 14-volt charging voltage is used as a light source for a lamp device, and said main battery has a 42-volt charging voltage;

said internal combustion engine is started by the electric power supplied from said main battery through said motor generator;

power is generated by said motor generator through rotation from said internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the generation mode using the power of the internal combustion engine after said internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than the charging voltage of said main battery, voltage control is performed to step down the generation voltage through said step-down chopper circuit so that it

agrees with the charging voltage of said main battery is reached.

37. (Previously Presented) A motor generator control method for a

hybrid car according to claim 29 wherein an auxiliary battery of 14-volt charging

voltage is used as a light source for a lamp device, and said main battery has a

42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than

the charging voltage of said main battery, voltage control is performed to step

down the generation voltage through said step-down chopper circuit so that it

agrees with the charging voltage of said main battery is reached.

38. (Previously Presented) A motor generator control method for a

hybrid car according to claim 30 wherein an auxiliary battery of 14-volt charging

Page 16 of 24

voltage is used as a light source for a lamp device and said main battery has a

42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than

the charging voltage of said main battery, voltage control is performed to step

down the generation voltage through said step-down chopper circuit so that it

agrees with the charging voltage of said main battery is reached.

39. (Previously Presented) A motor generator control method for a

hybrid car according to claim 31 wherein an auxiliary battery of 14-volt charging

voltage is used as a light source for a lamp device and said main battery has a

42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

Page 17 of 24

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than

the charging voltage of said main battery, voltage control is performed to step

down the generation voltage through said step-down chopper circuit so that it

agrees with the charging voltage of said main battery is reached.

40. (Previously Presented) A motor generator control method for a

hybrid car according to claim 32 wherein an auxiliary battery of 14-volt charging

voltage is used as a light source for a lamp device and said main battery has a

42-volt charging voltage;

said internal combustion engine is started by the electric power supplied

from said main battery through said motor generator;

power is generated by said motor generator through rotation from said

internal combustion engine, thereby charging the main battery; and

the battery is charged by operation of said motor generator in the

generation mode using the power of the internal combustion engine after said

internal combustion engine has started;

wherein, if the generation voltage of said motor generator is greater than

the charging voltage of said main battery, voltage control is performed to

Page 18 of 24

Serial No. 09/936,481 Amendment Dated: July 16, 2004 Reply to Office Action: March 16, 2004

step down the generation voltage through said step-down chopper circuit so that it agrees with the charging voltage of said main battery is reached.
